One in every three people globally is malnourished, and trends predict that this number will grow to one in two people soon if we continue with business as usual. Food systems are not keeping pace: they are not nourishing people and, at the same time, they are major contributors to environmental degradation and climate change. More commitments are needed from all nutrition actors to transform food systems into sustainable and healthy ones.

The aim of this side event is to provide an update on food systems for nutrition, where we currently are and what more needs to be done in view of the Nutrition for Growth Summit in Japan in 2020 and in the context of the UN Decade of Action on Nutrition and Agenda 2030.
